A snapshot of the webpage is shown below.

Article [Talk](#)

The following are lists of the largest **banks** in the world, as measured by market capitalization

The list is based on Forbes.com's ranking as of August 2023 based on an analysis of the bail the global economy.^[1]

Rank ↕	Bank name ↕	Market cap [hide] (US\$ billion) ↕
1	 JPMorgan Chase	419.25
2	 Bank of America	231.52
3	 Industrial and Commercial Bank of China	194.56
4	 Agricultural Bank of China	160.68
5	 HDFC Bank	157.91
6	 Wells Fargo	155.87
7	 HSBC Holdings PLC	148.90
8	 Morgan Stanley	140.83
9	 China Construction Bank	139.82
10	 Bank of China	136.81

Note: This is a live web page and it may get updated over time. The image shown above has been captured in November 2023. The process of data extraction remains the same.

```
import pandas as pd
URL = 'https://en.wikipedia.org/wiki/List_of_largest_banks'
tables = pd.read_html(URL)
```

```
df = tables[0]
print(df)
```

This will extract the required table as a dataframe `df`. The output of the print statement would look as shown below.

	Rank	Bank name	Market cap(US\$ billion)
0	1	JPMorgan Chase	419.25
1	2	Bank of America	231.52
2	3	Industrial and Commercial Bank of China	194.56
3	4	Agricultural Bank of China	160.68
4	5	HDFC Bank	157.91
5	6	Wells Fargo	155.87
6	7	HSBC Holdings PLC	148.90
7	8	Morgan Stanley	140.83
8	9	China Construction Bank	139.82
9	10	Bank of China	136.81

Although convenient, this method comes with its own set of limitations.

Firstly, web pages may have content saved in them as tables but they may not appear as tables on the web page.

For instance, consider the following URL showing the list of countries by GDP (nominal).

```
URL = 'https://en.wikipedia.org/wiki/List_of_countries_by_GDP_(nominal)'
```

The images on the web page are also saved in tabular format. A snapshot of the web page is shared below.

Table 2

Table

The table initially ranks each country or territory with their latest available estimates, and can be reranked by either of the sources

The links in the "Country/Territory" row of the following table link to the article on the GDP or the economy of the respective country or territory

Table 3

Secondly, the contents of the tables in the web pages may contain elements such as hyperlink text and other denoters, which are also scraped directly using the pandas method. This may lead to a requirement of further cleaning of data.

A closer look at table 3 in the image shown above indicates that there are many hyperlink texts which are also going to be treated as information by the pandas function.

We can extract the table using the code shown below.

```
import pandas as pd
```

```

URL = 'https://en.wikipedia.org/wiki/List_of_countries_by_GDP_(nominal)'
tables = pd.read_html(URL)
df = tables[2] # the required table will have index 2
print(df)

```

The output of the print statement is shown below.

	Country/Territory	UN region	IMF [1][13]		World Bank [14]		United Nations [15]
	Country/Territory	UN region	Forecast	Year	Estimate	Year	Estimate

Note that the hyperlink texts have also been retained in the code output.

It is further prudent to point out, that this method exclusively operates only on tabular data extraction. BeautifulSoup library still remains the default method of extracting any kind of information from web pages.
